

ACCESSORIES CONNECTION

1- **Fuse compartment** (surge protection with an 8 amp fuse).

2- **24V power supply.** When connected, the unit will turn on for a second with a beep and then shut down in order to demonstrate that there is power available and that the power converter is working.

3- **Connection for remote infrared heating belt** (optional use).

4- **Touchpad** in order to turn the main unit FLEX-ION-ZAPPER on or off.

5- **Connection for the banana-type insertion antistatic conduction wristband** which must be pushed firmly in order to put it into its connector.

6- **Connection for the ionizer** (ionizing cartridge).

7- **Connection for the conduction rods** (ZAPPER copper handles).

There are white markings around the front of the main unit in order to identify and locate the accessories plug-in. These must be connected to the left side for a single-activated device (only one active and lit side). Otherwise, choose the side of your choice for a dual-activated device (both sides active and lit). The left side and the right side are perfectly identical and work separately as two associated devices.
